

INTERFACE APPARATUS COMBINING DISPLAY PANEL AND SHAFT

Abstract

The interface apparatus includes a base, a shaft installed on the base in a moveable way, a detecting module for detecting movement of the shaft, and a display panel with at least a handle installed on the shaft. When a user holds the handle to move the display panel/shaft, a detecting signal, accordingly generated by the detecting module, can be transmitted to a mainframe of the computer system as an input of the computer system.
